Q: What does "overlapping resolution" mean? I'm a bit confused about the following statement: A: Yes, the money will come from Lucas County. B: I'm counting on you, Councillor Mayer. A: We've been working on this for two years. [...] We don't have enough overlapping resolution. What does "overlapping resolution" mean? Is it any calculation based on time scale? A: The "resolution" in overlapping resolution means that they are on the same level. If they are on different time-frames, it means that one level is doing the work on a longer time frame than the other level. Example: Both levels are used to select same counties, but level A has more detailed selection list and is able to select more in one time-frame (one year) than level B. A: Overlapping resolution may imply that one or more of the constituents (counties) have two or more independent overlapping resolutions in place on the same time-frame (e.g. one selects counties, another selects counties and specific cities within those counties, a third selects only cities but with a slightly different set of overlapping counties), as opposed to multiple resolutions in parallel but on different timeframes. A: The way I understand overlapping resolution is that A. has a more detailed set of criteria than B. Consequently, A. is more likely to select more items than B. I have no idea why A. doesn't have "enough overlapping resolution". The context was in a web development forum where the question was A. > I've been trying to get overlapping resolution with @B for days now. He's just won't budge. B. > What does that mean?!?!?! Q: Why does using nested inductors lower resonant frequency? I was wondering why using a closed loop of L1, C1 and R1 lowered the resonant frequency of a parallel resonant circuit containing L2, C2 and R2. Would appreciate any clarifications. A: All you are doing is using a closed loop to minimize the voltage drop in L1. A typical parallel resonant circuit will have the equivalent circuit as: simulate this circuit – Schematic created using CircuitLab If

Safety and effectiveness of powered intracorporeal lithotripsy: a multicenter study. The purpose of this study was to determine the safety and effectiveness of powered intracorporeal lithotripsy (PILT). Four study sites were used. The first was an academic medical center. The second was a university-affiliated, private, non-profit institution. The third was a tertiary care public hospital. The final site was an ambulatory surgical center (ASC). Chart review of all patients who had PILT at the four sites was performed. Procedural success was defined as successful fragmentation at index and repeat sessions, fragments being or =5 mm or >0.5 cm. Complications were defined as procedural-related complications that were not related to the presence of an infection. Sixty-six patients underwent PILT; 53 men and 13 women. The mean age was 55.8 years (range 19 to 83 years). Seventy-eight percent were stone free at the index treatment session; 96.6% were stone free at their second session. RF size ranged from 1 to 10 mm. Two patients had stones Q: Getting the values in the List box using Selenium I am having a List box with the values as follows, Initial Second Third Fourth I want to get all the values from the list. A: Use below code List listBox = driver.findElements(By.id("listbox")); for
