Lpe mac.G-CSF-induced neutrophil mobilization depends on the interaction of two receptors. Granulocyte-colony stimulating factor (G-CSF) stimulates a variety of biological activities in bone marrow neutrophil granulocyte precursors. It is known that some of these activities may be independent of G-CSF binding to its receptor. Therefore, we tested the hypothesis that the G-CSF-induced mobilization of neutrophils to the peripheral blood stream may be explained by an independent G-CSF receptor on the bone marrow neutrophil granulocyte precursor. We therefore studied the effects of anti-G-CSF monoclonal antibody on neutrophil mobilization induced by G-CSF. The dose-response relationships for G-CSF and granulocyte-macrophage colony-stimulating factor were studied in mice after the administration of anti-G-CSF antibody or control IgG. Our results show that G-CSF doses of less than 1 microgram/kg, but not doses of greater than 1 microgram/kg, resulted in a significant depletion of neutrophil numbers in the

peripheral blood. The administration of 2.5 micrograms/kg G-CSF in combination with anti-G-CSF did not result in the depletion of the neutrophil pool, although this effect was observed when anti-G-CSF was administered in doses of 0.25 and 0.5 microgram/kg. No depletion of neutrophil numbers was observed in mice treated with either 2.5 micrograms/kg or 5 micrograms/kg G-CSF alone. However, neutrophil numbers were significantly depleted in mice treated with 12 micrograms/kg G-CSF plus anti-G-CSF. These studies show that the mobilization of bone marrow neutrophil granulocyte precursors to the peripheral blood can be induced by high doses of G-CSF but not by lower doses of G-CSF. We conclude that G-CSF-induced neutrophil mobilization to the blood stream is dependent on the interaction of a high-affinity G-CSF receptor on the bone marrow granulocyte precursor. The biological role of this receptor is not known but may be

The real.Q: How to get predictions from Keras autoencoder, not encodings? My model has

multiple input feature maps, and output a single digit character. I have trained the model using samples, and as such, I can predict the output

character using sample inputs, but the prediction step is not shown, and it returns the original input instead (I know it might get an

error if input is too short). How can I use Keras's predict() or predict_classes() to show the
